

Overview of the Project Concept

The Vehicle Rental Management System is an information technology system designed to handle and automate all daily activities carried out within a car rental firm. Today, most of the rental firms depend on manual ways of operation, which are time-consuming and have a potential to lead to errors like double booking. The Vehicle Rental Management System will offer a single platform through which customers are able to find details about available vehicles, their prices, and book for them even from home instead of going to the office. The two users of the system include the Customer and the Admin. The system will allow the customer to register easily, search for vehicles according to their type, price, or availability, and book the vehicle for specified dates. The Admin will be able to manage everything related to the business through the system including; adding vehicles, updating status of vehicles, managing customers' data, confirming bookings, processing return of vehicles, payment procedures, and finally generate reports on rentals and income.
